Preliminary study

1.1 Introduction

In this chapter we will go over some general definition, study of the existing and analysis of existing applications. All about the topic of computer architecture in the form of an interactive course.

1.2 General Definitions

1.2.1 Website

A website is a collection of publicly accessible, interlinked Web pages that share a single domain name. Websites can be created and maintained by an individual, group, business or organization to serve a variety of purposes.[\[1\]](#)

1.2.2 Responsive Web Design

Responsive web design (RWD) is a web development approach that creates dynamic changes to the appearance of a website, depending on the screen size and orientation of the device being used to view it. RWD is one approach to the problem of designing for the multitude of devices available to customers, ranging from tiny phones to huge desktop monitors.[\[2\]](#)

1.2.3 Interactive Course

The term "Interactive Course" (IC) typically describes material of an educational nature delivered in a format which allows the user to directly impact the materials content, pace, and out-come. An example of such material would be a computer based presentation requiring a user to select the correct answer to a give question before proceeding to the next topic. These types of courses are almost always computer based and most likely to be delivered to the user thru the internet. Due to their convenient delivery, availability and almost endless subject matter, interactive courses have become a major tool for those seeking to provide as well as those seeking to obtain education, training or certification in a given area of study.

With growing access and availability to computers and the internet, many schools, universities, businesses and government agencies are turning to IC's to train and educate their students and staff.[3]

1.2.4 Computer Architecture

In general

Computer architecture is a science or a set of rules stating how computer software and hardware are joined together and interact to make a computer work. It not only determines how the computer works but also of which technologies the computer is capable.[4]

In our case

Computer architecture or better known as "Structure Machine"(STRM) is a course for first-year students in the Math and Computer Science department (MI) of the university bouira AMO. and also in all the MI departments in Algeria universities.

Computer architecture (STRM) has a coefficient of 3 and a credit of 5, which makes it one of the more fundamental courses.

1.3 Study of the existing

We did go over the definition of computer architecture in a general sense and in our context of study(STRM), so in this part we will go more in-depth about the structure of the computer architecture(STRM) course (see Figure 1.1), and which resources we will be basing our own study of the course from.

1.3.1 Structure of the computer architecture course

The structure of the STRM course (see Figure 1.1) was fully based from our study of the STRM 1 Book[5].

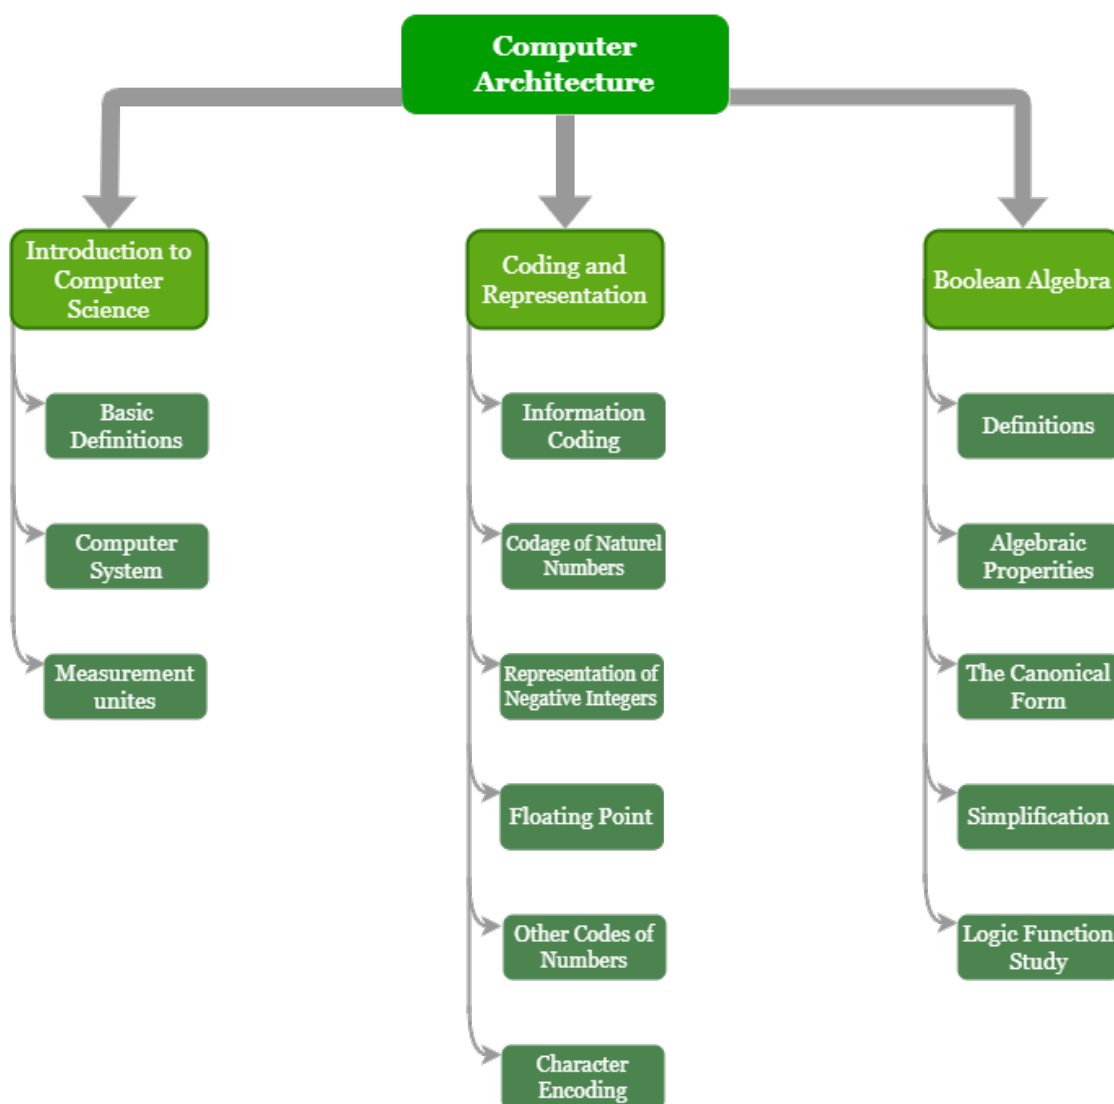

Figure 1.1: Structure of STRM

1.3.2 Computer architecture course

there exists some books that cover the course of computer architecture, and based on our experience as a students of the MI department that has already studied this course we would like to mention the following :

Digital Design and Computer Architecture :

This book by David Harris and Sarah Harris is designed for courses that combine digital logic design with computer organization/architecture or that teach these subjects as a two-course sequence. Digital Design and Computer Architecture begins with a modern approach by rigorously covering the fundamentals of digital logic design and then introducing Hardware Description Languages (HDLs). By the end of Digital Design and Computer Architecture, readers will be able to build their own microprocessor and will have a top-to-bottom understanding of how it works—even if they have no formal background in design or architecture beyond an introductory class. [6]

STRM 1 Book :

This book by Dr. Taha Zerrouki is a lessons and solved exercises focus, intended for first-year students of mathematics and Computer Science department (MI) in Algerian universities.[5]

It contains in this part the lessons of the first semester:

- Interoduction to computer science.
- Coding and representation of information.
- Boolean Algebra.

The book contains a large number of exercises divided according to chapters, a large part of it is solved, as well as a special section for continuous assessment examinations with Correction, and another section for exams. This book comes as a result of the experience that Dr Taha gained in teaching at the University of Bouira for many years in the Department of Computer Science. The book is also bilingual, with lessons in French and translated into Arabic, in order to help new students who suffer from a language barrier in their college start. ¹

¹We will be focusing our study of the course on the STRM 1 book [5]

1.4 Analysis of existing applications

A very important part in developing a new project in the domain of computer science is looking for and analyzing already existing solutions to the project you are working on, in our case the project is making an **Interactive Course For Computer Architecture**. if there is no already existing solutions you would look for solutions that are somehow related (similar) to the project at hand.

In our case and as far as our search goes there are no already existing solutions(neither apps nor websites), but there exists some tools, websites and mobile apps that are somewhat related to our project. like:

1.4.1 STRM Tests :

This tool was build by Dr. Taha Zerrouki to generate and create random tests for computer architecture 1 (STRM 1) - first Year MI in Algerian universities.[7] the features of the **STRM Tests** tool[7] are:

- Generate checks and questions with solutions.
- Supports the following classes:
 1. Enumeration systems.
 2. Representation of natural and real numbers and letters.
 3. Encoding information.
 4. Boolean algebra.
- Generate answers:
 1. Possibility to draw a logical function diagram.
 2. Generate Karnoff tables.
 3. Generating graphic solutions to Karnoff's table.
- Generate duplicate forms of questions for easier typing.
- Random generation of questions.

1.4.2 CS301 Computer Architecture :

Saylor Academy is a nonprofit initiative working since 2008 to offer free and open online courses to all who want to learn. they offer nearly 100 full-length courses at the college and professional levels, each of which is available right now . Modern computer technology requires an understanding of both hardware and software, since the interaction between the two offers a framework for mastering the fundamentals of computing. The purpose of this course is to cultivate an understanding of modern computing technology through an in-depth study of the interface between hardware and software. In the CS301 Computer Architecture course you will study the history of modern computing technology before learning about modern computer architecture and a number of its essential features, including :

- instruction sets
- processor arithmetic and control
- the Von Neumann architecture
- pipelining, memory management, storage, input/output

The course will conclude with a look at the recent switch from sequential processing to parallel processing by looking at the parallel computing models and their programming implications.[\[8\]](#)

1.4.3 BooleanTT :

This is a simple and easy-use app developed by Hashan Chamara Rajapaksa to :

- Simplify/Minimize Boolean expressions
- solve Karnaugh maps
- generate Truth-Tables of Boolean expressions
- generate SOP and POS from Truth-Table easily
- check logic circuit

And also it will help you learn about basic logic gates theories.[\[9\]](#)

1.4.4 DecToBin :

This application is developed by Kyssnar, it allows you to encode numbers in base 10 to different formats of binary coding:

- IEEE 32 and 64 bits
- One's and Two's Complement
- Binary Code Decimal
- Excess to N
- Excess to N - 1
- Signed Magnitude
- Simple and double precision

Also includes a binary calculator that can add, subtract, multiply and divide in binary and show results in binary and decimal.[10]

1.4.5 Summary :

We summarized the previous study in this Table 1.1.

	Courses			Tests		
	Intro CS	Code Reprsnt	Bool Algebr	Intro CS	Code Reprsnt	Bool Algebr
STRM Tests				X	X	X
CS301	X	X	X			
BooleanTT			X			X
DecToBin					X	

Table 1.1: Analysis of existing summary table

1.5 Conclusion

We have done an analytical(Preliminary) study to the problem at hand, and we found some partial solutions and ideas that will hopefully help us reach the end goal.

In the next part we will see the conceptual study.

Conceptual study

2.1 introduction

This chapter describes a very important part which is the conceptual study and an analytical look in addition to the base design.

This part define the basic steps for developing our system where specifying functional and non-functional requirements using the concepts of Unified Modeling Language (Use Case diagram, Sequence diagrams, and Class diagram), and clarify the goal of this analysis and design.

2.2 Graphic design :

2.2.1 Modeling

Modeling uses graphic notation to create visual models of software systems, the use of diagrams and illustrations makes something complex more understandable, that's why Unified Modeling language (UML) [11] is a standardized modeling language enabling developers to specify, visualize, construct and document artifacts of a software system.

Thus, UML makes these artifacts scalable, secure and robust in execution. It is an important aspect involved in object-oriented software development.

2.2.2 definition of Unified Modeling language:

The Unified Modeling Language (UML) [2.1](#) is a general-purpose, developmental, modeling language in the field of software engineering that is intended to provide a standard way to visualize the design of a system.

The creation of UML was originally motivated by the desire to standardize the disparate notational systems and approaches to software design. It was developed at Rational Software in 1994–1995, with further development led by them through 1996.

In 1997, UML was adopted as a standard by the Object Management Group (OMG), and has been managed by this organization ever since. In 2005, UML was also published by the International Organization for Standardization (ISO) as an approved ISO standard. Since then the standard has been periodically revised to cover the latest revision of UML. In software engineering, most practitioners do not use UML, but instead produce informal hand drawn diagrams; these diagrams, however, often include elements from UML.[\[12\]](#)

Figure 2.1: UML

2.3 Specication and needs analysis:

2.3.1 Basic functions of the application:

The main requirements which are specifically related to the behavior and functions of the system can be summarized in the following points :

- 1-Interactive course with practical examples.
- 2-Fun Quiz and testing what the user has learned.
- 3-Practical models for machine structure tests.

2.3.2 Non-functional needs:

These are the most important major requirements not specifically related to the behavior of the system but rather the identification of internal and external constraints of the system :

Ergonomic interfaces:

the solution must present an ergonomic interface encompassing all the functionalities. The manipulation of the interface should not require advanced computer knowledge, it must be simple and clear in order to adapt to the computer knowledge of the users.

Reliability and speed:

The system must guarantee the speed and reliability of the search for information, as well as optimal management of resources.

The code:

Must be clear to allow future evolutions or improvements.

2.4 Detailed design:

2.4.1 Use Cas diagram:

Use Case Diagram describes functionality of a system in terms of actors, goals as use cases and dependencies among the use cases.[11]

System:

Interactive Course For Structure Machine 1 .

actors:

specify a role played by a user or any other system interacting with the subject.[11]

use cases:

describes functionalities of the system . in this system :

1-COURSE : When user click on COURSE he can see the hole CHAPTERS of the course, when he click on try in each TITLE of CHAPTERS a question window will appear with a specific type of question depends on the chapter's TITLE.

2-QUIZ : When user click on QUIZ he can test what he learned in this course with a specific Options (choose chapters and number of questions), when clicking on start a question window will appear .

3-TEST : When user click on TEST he will find a practical models for machine structure tests including the hole course .

4-ABOUT : When user click on TEST he will see the informations of this system's developers .

Relations:

1- INCLUDE : (QUIZ and Options),(Options and Question),(TEST and Question).

2- EXTENTION : the rest of use cases .

The figure 2.2 represents this system's Use Case Diagram.

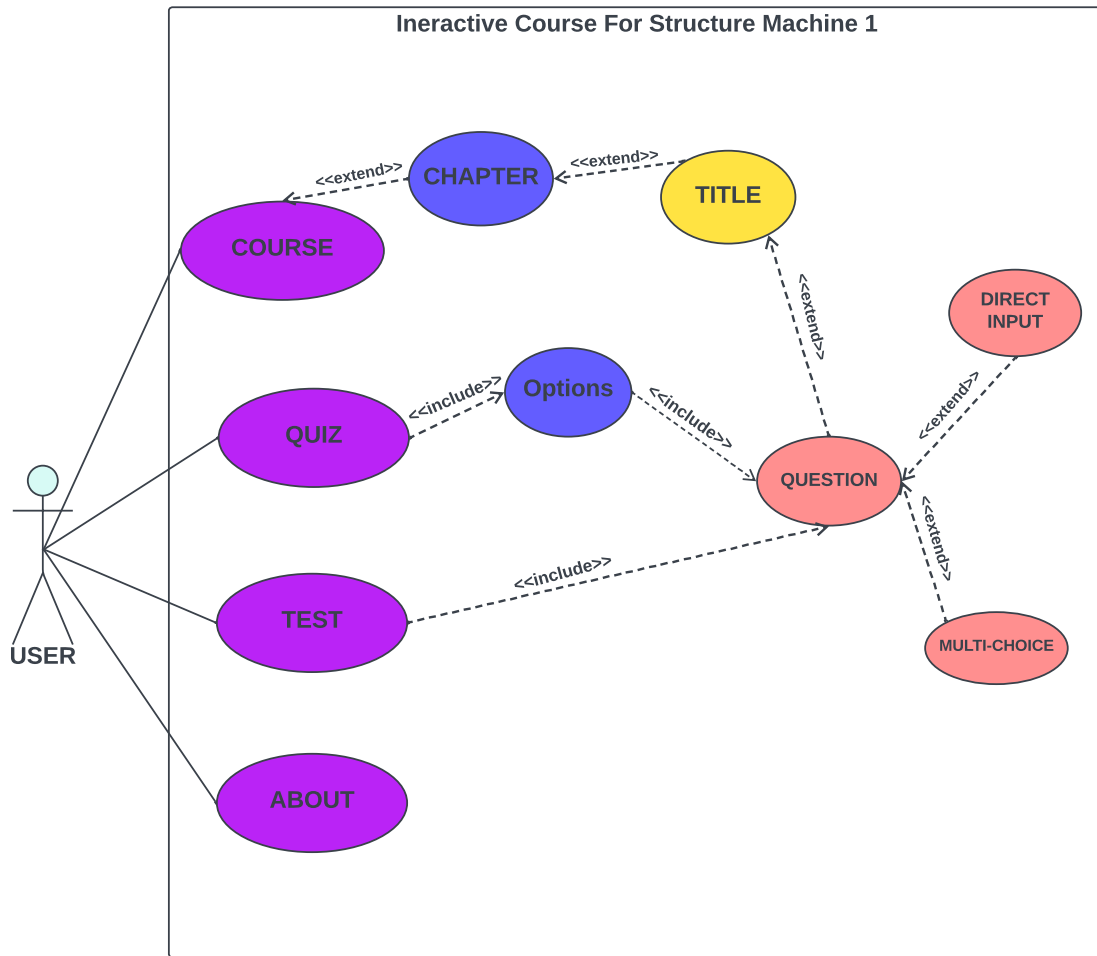

Figure 2.2: Use Case diagram.

2.4.2 Sequence diagrams:

A sequence diagram, in the context of UML, represents object collaboration and is used to define event sequences between objects for a certain outcome, it is an essential component used in processes related to analysis, design and documentation.[\[13\]](#)

A sequence diagram is also known as a timing diagram, event diagram and event scenario.[\[13\]](#)

2.4.3 COURSE:

This first scenario shows how user can see the hole CHAPTERS of the course, and try a question with a specific type depends on the chapter's TITLE.

Identification summary	
Use Case Title	COURSE.
Abstract	User learn course.
Actor	User.
Identification summary	
Preconditions	Accessible system.
User exists	The purpose of this system is navigate and learn from the course.
Scenario	1- User clicks on Course button. 2- System loads all chapters. 3- System shows the names of chapters. 4- User chooses chapter. 5- System loads titles of chapter . 6- System shows the content of titles . 7- User clicks on Try. 8- System sends SQL requeste (Select title's question) to DataBase. 9- Database return data(title's question). 10- System loads results. 11- System shows results.
Object	User learn the course with live examples.

Table 2.1: Text Description of Use Case "COURSE".

The figure 2.3 represents COURSE Sequence diagram.

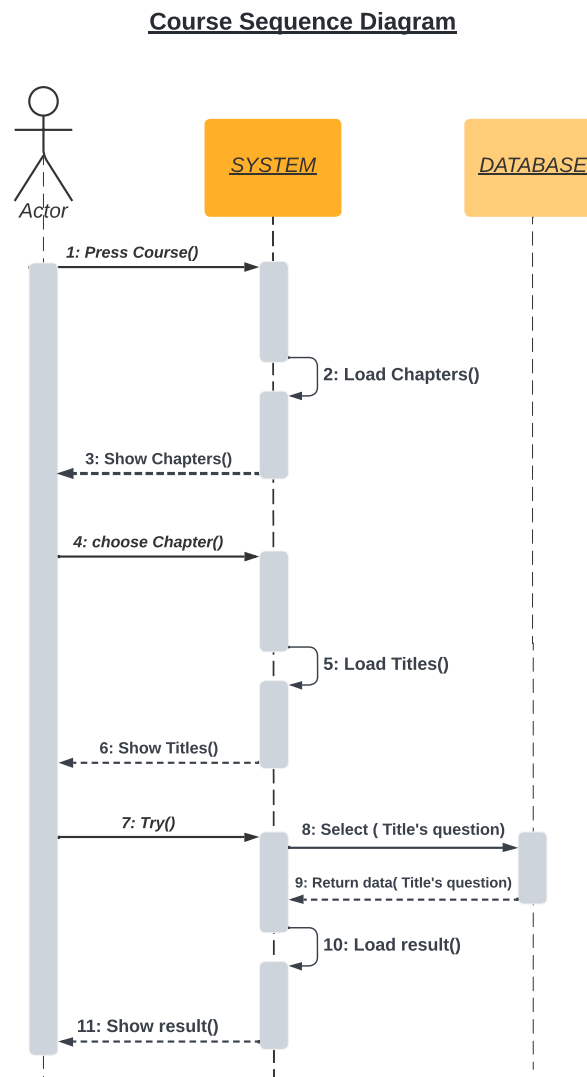

Figure 2.3: COURSE Sequence diagram.

2.4.4 QUIZ:

This second scenario shows how user can test what he learned in this course with a specific Options (choose chapters and number of questions).

Identification summary	
Use Case Title	QUIZ.
Abstract	User takes a quiz.
Actor	User.
Identification summary	
Preconditions	Accessible system.
User exists	The purpose of this system is taking a quiz.
Scenario	1- User clicks on Quiz button. 2- System loads Options. 3- System shows Options. 4- User chooses options. 5- System shows Start button . 6- User clicks on Start button . 7- System sends SQL requeste (Select Questions) to DataBase . 8- Database return data(Questions) . 9- System loads Quiz results. 10- System shows Quiz results.
Object	User can take a quiz with any options he wants .

Table 2.2: Text Description of Use Case "QUIZ".

The figure 2.4 represents QUIZ Sequence diagram.

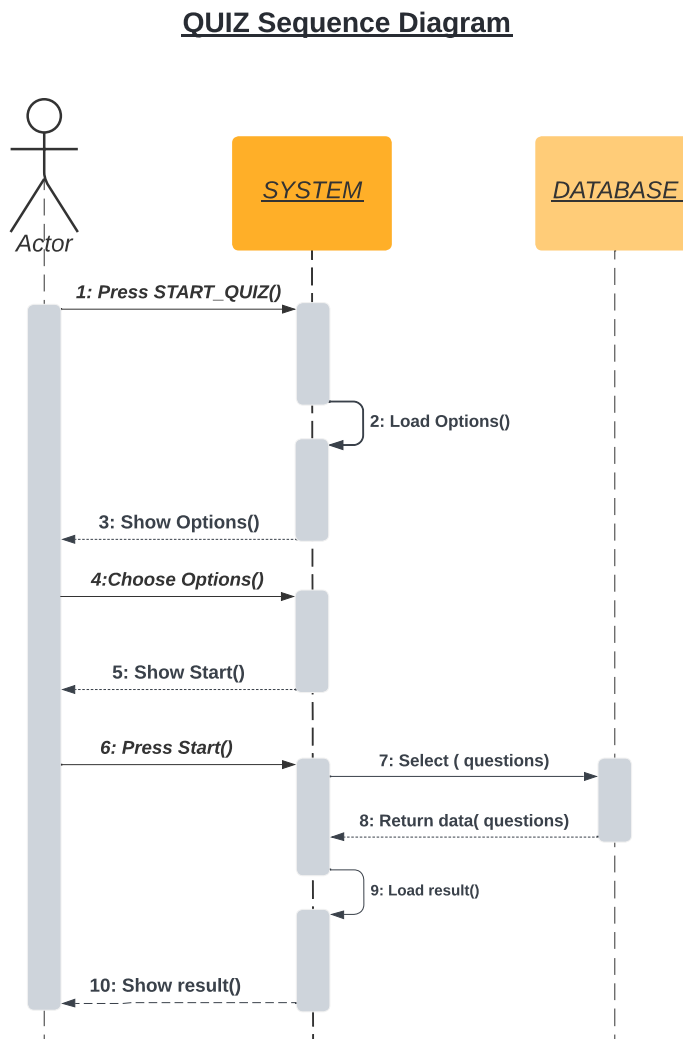

Figure 2.4: QUIZ Sequence diagram.

2.4.5 TEST:

This third scenario shows how user can find a practical models for machine structure tests including the hole course .

Identification summary	
Use Case Title	Test.
Abstract	User takes a Test.
Actor	User.
Identification summary	
Preconditions	Accessible system.
User exists	The purpose of this system is taking a Test.
Scenario	1- User clicks on Test button. 2- System shows Start button . 3- User clicks on Start button . 4- System sends SQL requeste (Select Question from each chapter) to DataBase . 5- Database return data(Question from each chapter) . 6- System loads Test results. 7- System shows Test results.
Object	user can find a practical models for machine structure tests including the hole course.

Table 2.3: Text Description of Use Case "TEST".

The figure 2.5 represents TEST Sequence diagram.

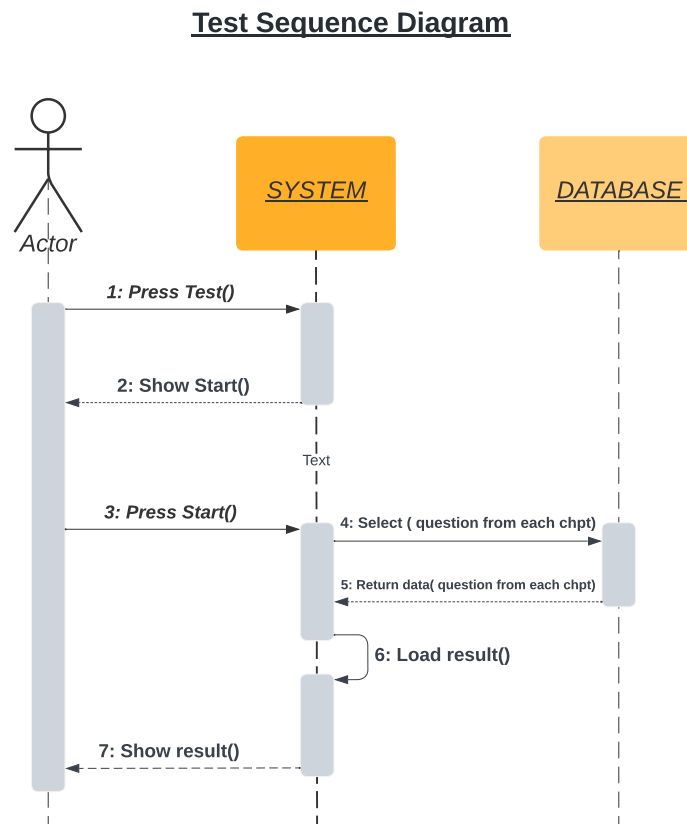

Figure 2.5: TEST Sequence diagram.

2.4.6 ABOUT:

This last scenario shows how user can find more details and informations of this system's developers .

Identification summary	
Use Case Title	About.
Abstract	User sees about.
Actor	User.
Identification summary	
Preconditions	Accessible system.
User exists	The purpose of this system is see who develop- dthis system.
Scenario	1- User clicks on About button. 2- System loads content . 3- System shows content .
Object	user can find more details and informations of this system's developers .

Table 2.4: Text Description of Use Case "ABOUT".

The figure 2.6 represents TEST Sequence diagram.

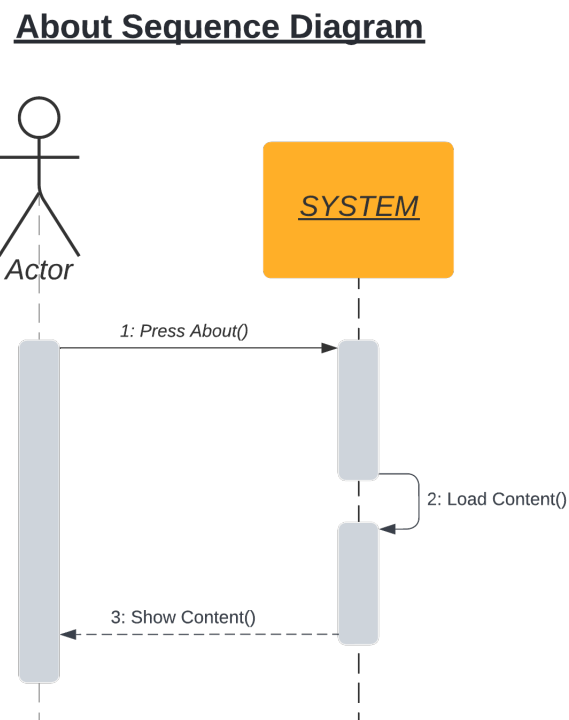

Figure 2.6: ABOUT Sequence diagram.

2.4.7 Class Diagram:

A class diagram is a type of diagram and part of a unified modeling language (UML) that defines and provides the overview and structure of a system in terms of classes, attributes and methods, and the relationships between different classes.

It is used to illustrate and create a functional diagram of the system classes and serves as a system development resource within the software development life cycle. [14]

Why Class Diagram?

A class diagram is primarily designed for developers to provide the conceptual model and architecture of the system being developed. Typically, a class diagram consists of more than one class or all the created classes for a system. [14]

It is a type of structure diagram and looks similar to a flow chart having three main parts illustrated in rectangular boxes. The first or top part specifies the class name, the second or middle specifies attributes of that class and the third or bottom section lists the methods or operations that specific class can perform. [14]

The figure 2.7 represents this system's Class Diagram.

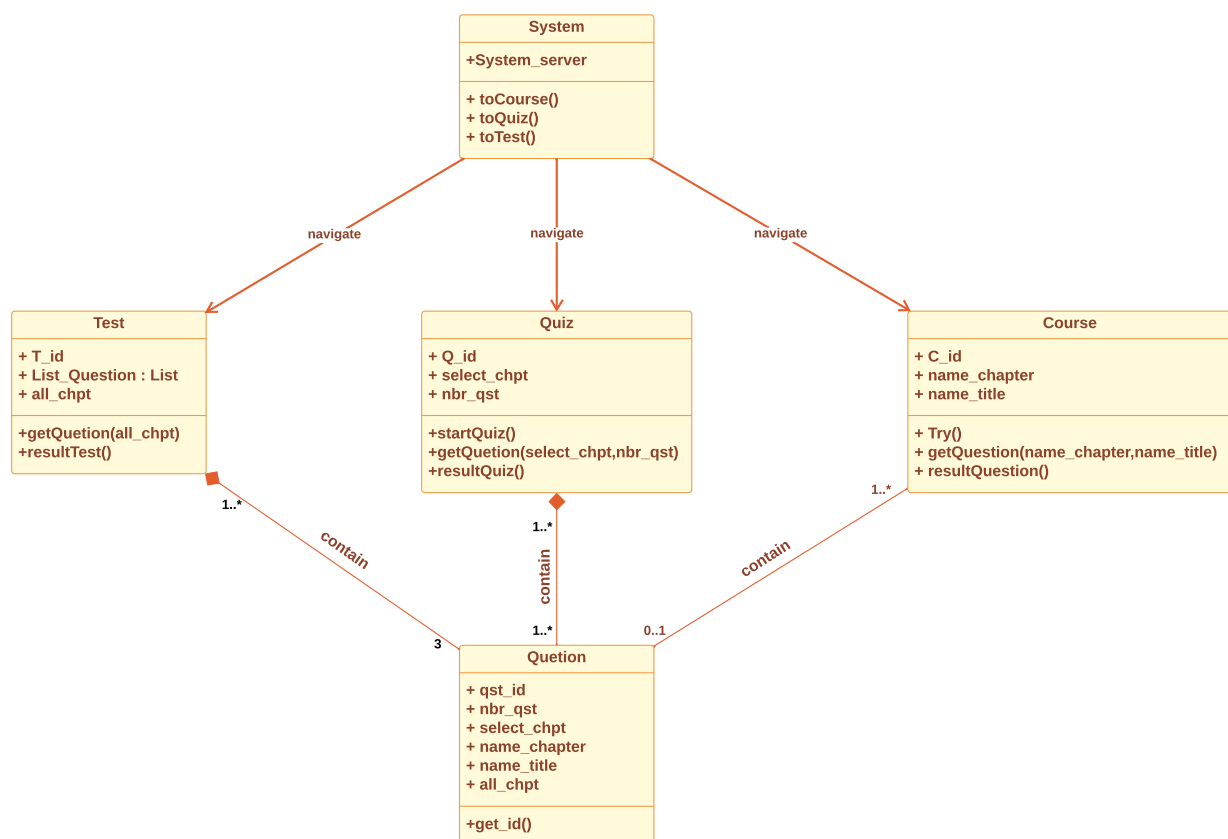

Figure 2.7: Class Diagram.

The table 2.5 represents classes and attributes as well as their types and description .

Class	attributes	Description	Type
System	System-server	system's identifier	Digital
Course	C-id	Course identifier	Digital
	name-chapter	chapter's name	Alphabetic
	name-title	title's name	Alphabetic
Quiz	Q-id	Quiz identifier	Digital
	select-chpt	choosing chapter	Digital
	nbr-qst	number of questions	Digital
Test	T-id	Test identifier	Digital
	List-Question	List of questions	Alphabetic
	all-chpt	choosing from all chapters	Digital
Question	qst-id	Question identifier	Digital
	nbr-qst	number of questions	Digital
	select-chpt	choosing chapter	Digital
	name-chapter	chapter's name	Alphabetic
	name-title	title's name	Alphabetic
	all-chpt	choosing from all chapters	Digital

Table 2.5: Description of Class Diagram.

Database's Class Diagram:

The figure 2.8 represents the database in the form of a class diagram.

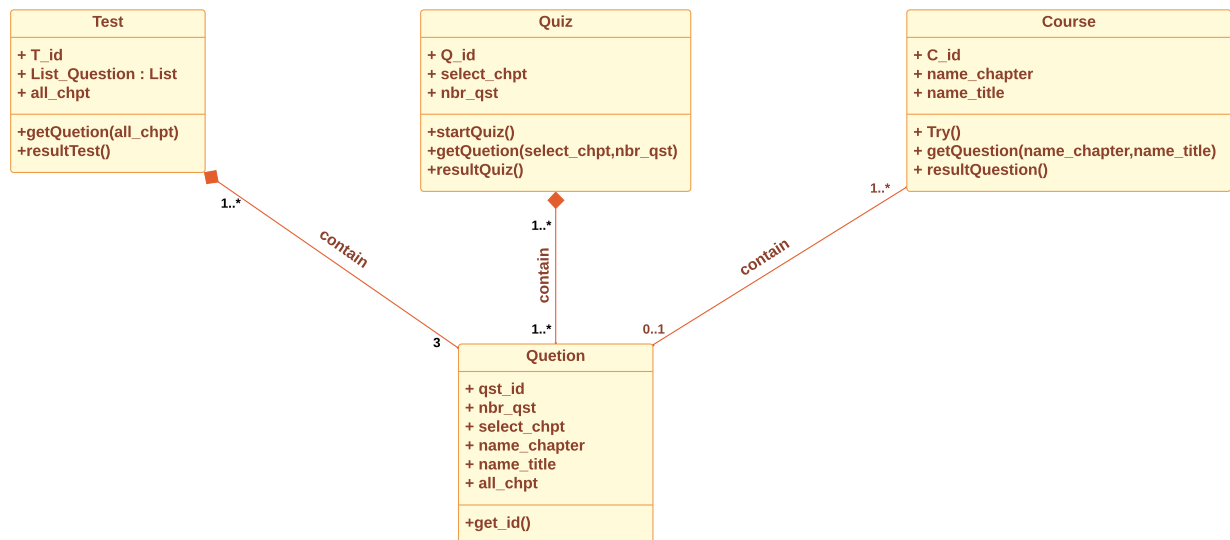

Figure 2.8: Database's Class Diagram.

The table 2.6 represents classes and attributes of database's class diagram as well as their types and description .

Class	attributes	Description	Type
Course	C-id	Course identifier	Digital
	name-chapter	chapter's name	Alphabetic
	name-title	title's name	Alphabetic
Quiz	Q-id	Quiz identifier	Digital
	select-chpt	choosing chapter	Digital
	nbr-qst	number of questions	Digital
Test	T-id	Test identifier	Digital
	List-Question	List of questions	Alphabetic
	all-chpt	choosing from all chapters	Digital
Question	qst-id	Question identifier	Digital
	nbr-qst	number of questions	Digital
	select-chpt	choosing chapter	Digital
	name-chapter	chapter's name	Alphabetic
	name-title	title's name	Alphabetic
	all-chpt	choosing from all chapters	Digital

Table 2.6: Description of Database's Class Diagram.

2.4.8 The relational model and creation of the Database:

A relational data model involves the use of data tables that collect groups of elements into relations. These models work based on the idea that each table setup will include a primary key or identifier. Other tables use that identifier to provide "relational" data links and results. Database administrators use something called Structured Query Language (SQL) to retrieve data elements from a relational database.[15]

Course(C-id, //name-chapter, //name-title).

Quiz(Q-id, //select-chpt, //nbr-qst).

Test(T-id, List-Question, //all-chpt).

Question(qst-id, nbr-qst, select-chpt, name-chapter, name-title, all-chpt).

2.5 Conclusion:

This chapter defined the basic steps for developing the system where specified functional and non-functional requirements using the concepts of Unified Modeling Language (Use Case diagram, Sequence diagrams, and Class diagram), and clarified the goal of the analysis and design. Next step is realizing the system by introducing the programming languages, tools, and development environment used on implementation.

Implementation and evaluation

3.1 Introduction:

Lorem ipsum dolor sit amet, consectetur adipisicing elit, sed do eiusmod tempor incididunt ut labore et dolore magna aliqua. Ut enim ad minim veniam, quis nostrud exercitation ullamco laboris nisi ut aliquip ex ea commodo consequat. Duis aute irure dolor in reprehenderit in voluptate velit esse cillum dolore eu fugiat nulla pariatur. Excepteur sint occaecat cupidatat non proident, sunt in culpa qui officia deserunt mollit anim id est laborum.

3.2.1 Hardware:

For programming we used a laptop, as for testing we used mobile phones, laptops, tablets and even a smart tv to monitor the performance of the website on them. The characteristics of these devices are:

- LENOVO laptop(for programming):
 - Processor : Intel (R) Core (TM) i7-7600U CPU @ 2.80 GHz(4 CPUs), 2.90 GHz.
 - RAM : 16 GB.
 - System : Windows 10 Pro - 64 Bit.
- Consectetur adipisicing elit;
- Fin.
